## **Premises**

- Research in IR has frequently been criticized on two fronts
  - Lack a solid formal framework as a basic foundation
    - The inherent degree of psychological subjectiveness associated with the task decides the relevance of a given document
      - Difficult to dismiss entirely
    - Relevance can be binary or graded
      - Binary relevance: relevant and not relevant
      - Graded relevance: e.g., highly relevant, (mildly) relevant and not relevant
  - Lack robust and consistent testbeds and benchmarks
    - Small test collections did not reflect real-world applications
    - No widely accepted benchmarks
      - Comparisons between various retrieval systems were difficult (different groups focus on different aspects of retrieval)

## The TREC Collection

- <u>Text REtrieval Conference</u> (TREC)
  - Established in 1991, co-sponsored by the National Institute of Standards and Technology (NIST) and the Defense Advanced Research Projects Agency (DARPA)
    - Evaluation of large scale IR problems
  - The premier annual conference was held at NIST in Nov. 1992
    - Most well known IR evaluation setting

# TREC Goals

- To increase research in information retrieval based on large-scale collections
- To provide an open forum for exchange of research ideas to increase communication among academia, industry, and government
- To facilitate technology transfer between research labs and commercial products
- To improve evaluation methodologies and measures for text retrieval
- To create a series of text collections covering different aspects of text retrieval

# A Brief History of TREC

- 1992: first TREC conference
  - started by Donna Harman and Charles Wayne as 1 of 3 evaluations in DARPA's TIPSTER program
  - first 3 CDs of documents from this era,
     hence known as the "TIPSTER" CDs
  - open to IR groups not funded by DARPA
    - · 25 groups submitted runs
  - two tasks: ad hoc retrieval, routing
    - 2GB of text, 50 topics
    - primarily an exercise in scaling up systems

# A Brief History of TREC

- 1993 (TREC-2)
  - true baseline performance for main tasks
- 1994 (TREC-3)
  - initial exploration of additional tasks in TREC
- 1995 (TREC-4)
  - official beginning of TREC track structure
- 1998 (TREC-7)
  - routing dropped as a main task, though incorporated into filtering track
- 2000 (TREC-9)
  - ad hoc main task dropped; first all-track TREC

## TREC - Test Collection and Benchmarks

### TREC test collection consists

- The documents
- The example information requests/needs (called **topics** in the TREC nomenclature)
- A set of relevant documents for each example information request

## Benchmark Tasks

- Ad hoc task
  - New queries against a set of static docs
- Routing task
  - Fixed queries against continuously changing doc
  - The retrieved docs must be ranked
- Other tasks started from TREC-4

Training/Development Collections

## **TREC - Document Collection**

• Example: TREC-6

## TREC Topic Example

<num> Number: 794 taken as a short query, more typical of a web application
<title> pet therapy
taken as a long query, more typical of a web application
<desc> Description:
How are pets or animals used in therapy for humans and what are the
benefits?
describe the criteria for relevance, used by the people doing relevance judgments, and not taken as a query

<narr> Narrative: \_\_\_

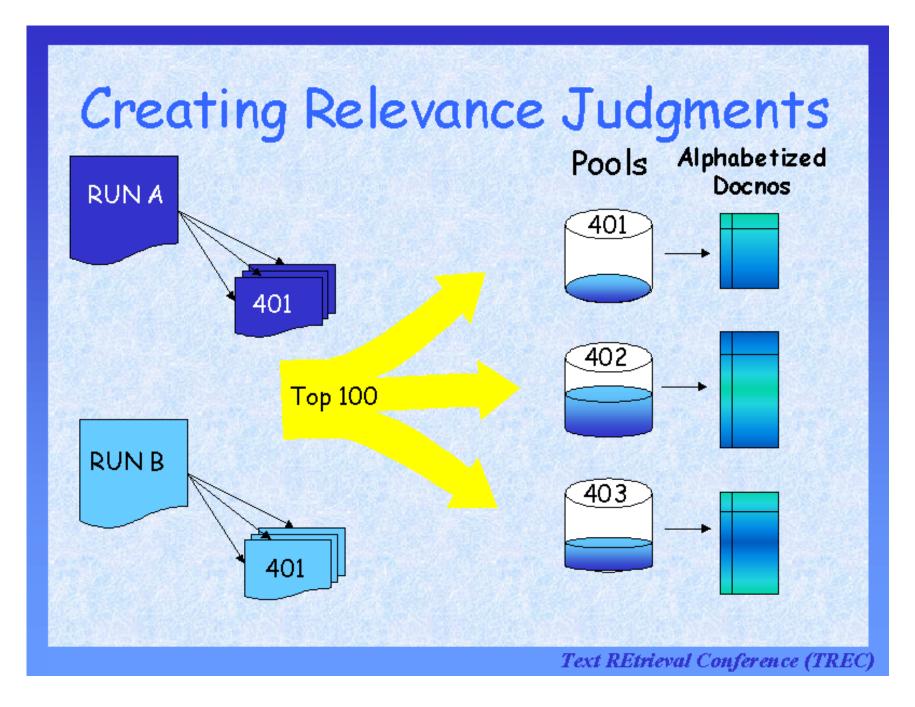

Relevant documents must include details of how pet- or animal-assisted therapy is or has been used. Relevant details include information about pet therapy programs, descriptions of the circumstances in which pet therapy is used, the benefits of this type of therapy, the degree of success of this therapy, and any laws or regulations governing it.

</top>

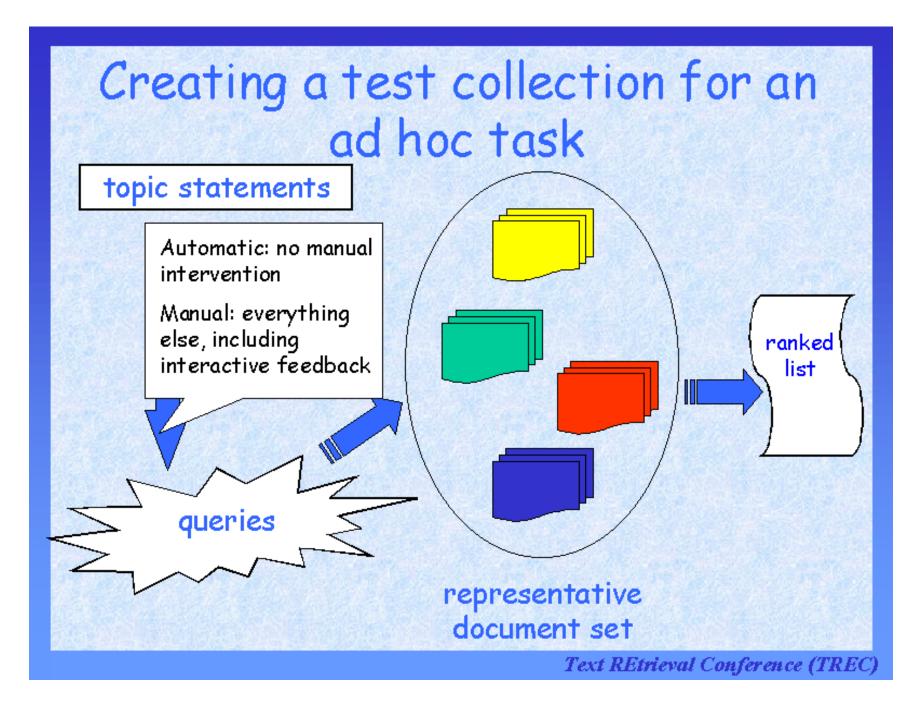

# TREC - Creating Relevance Judgments

- For each topic (example information request)
  - Each participating systems created top K (set between 50 and 200) documents and put in a pool
  - Duplicates are removed, while documents are presented in some random order to the relevance judges
  - Human "assessors" decide on the relevance of each document
    - Usually, an assessor judged a document as relevant (most are binary judgments) if it contained information that could be used to help write a report on the query topic
- The so-called "pooling method"
  - Two assumptions
    - Vast majority of relevant documents is collected in the assembled pool
    - Documents not in the pool were considered to be irrelevant
  - Such assumptions have been verified to be accurate!

# Evaluation: How well does system meet information need?

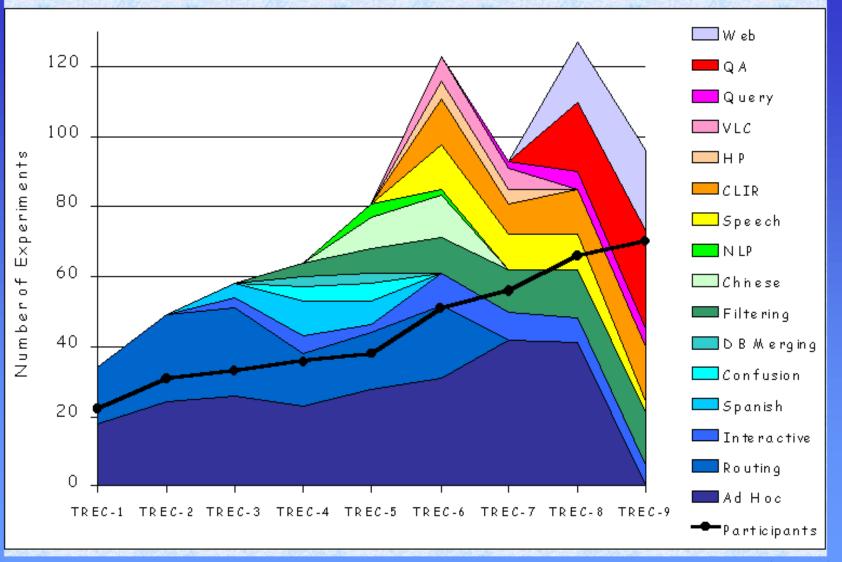

- System evaluation: how good are document rankings?
- User-based evaluation: how satisfied is user?

# Evaluation of Ranked Lists

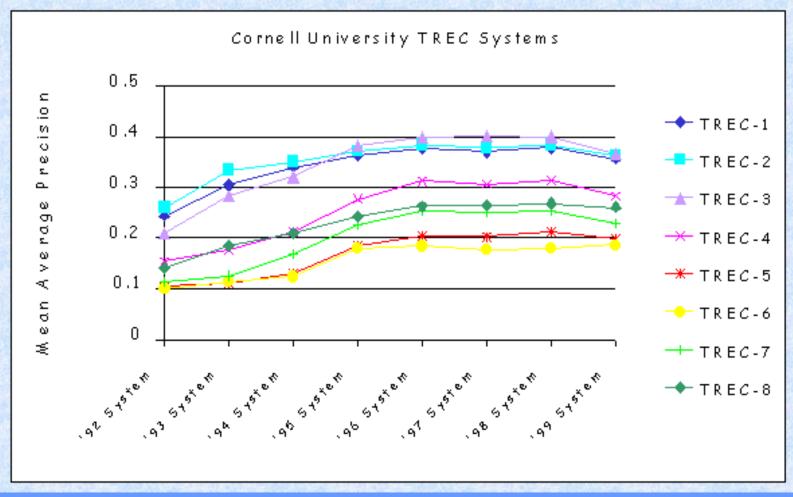

- Recall-precision curves
  - precision is the proportion of retrieved documents that are relevant
  - recall is the proportion of relevant documents that are retrieved
- · Mean average precision
  - ranges between 0 and 1, inclusive
  - AP for 1 topic is the precision after each relevant document retrieved; MAP is mean over all topics
  - equal to the area underneath an uninterpolated recall-precision curve

# TREC Tasks

## TREC Tracks Answers, not documents A&Q Web Web searching Very large corpus Video Beyond text Speech OCR $X \rightarrow \{X,Y,Z\}$ Beyond just English Chinese Spanish Human-in-the-loop Interactive Filtering Routing Streamed text Ad Hoc Static text 1992 1993 1994 1995 1996 1997 1998 1999 2000 2001 Text REtrieval Conference (TREC)

# TREC Impacts

## TREC – Pros and Cons

#### Pros

- Large-scale collections applied to common task
- Allows for somewhat controlled comparisons

#### Cons

- Time-consuming in preparation and testing
- Very long queries, also unrealistic
- A high-recall search task and collections of news articles are sometimes inappropriate for other retrieval tasks
- Comparisons still difficult to make, because systems are quite different on many dimensions
- Also, topics used in every conference year present little overlap, which make the comparison difficult
- Focus on batch ranking rather than interaction
  - There is an interactive track already

## Some Experiences Learned from TREC

- An analysis of TREC experiments has shown that
  - With 25 queries, an absolute difference in the effectiveness measure mAP of 0.05 will results in the wrong conclusion about which system is better is about 13 % of the comparisons
  - With 50 queries, this error rate falls below 4% (which means an absolute difference of 0.05 in mAP is quite large)
  - If a significance test is used, a relative difference of 10 % in mAP is sufficient to guarantee a low error rate with 50 queries
- If more relevance judgments are made possible, it will be more productive to judge more queries rather than to judge more documents from existing queries
- Though relevance may be a very subjective concept
  - Differences in relevance judgments do not have a significant effect on the error rate for comparisons (because of "narrative"?)

## Other Collections

#### The CACM Collection

- 3204 articles (only containing the title and abstract parts)
   published in the Communications of the ACM from 1958 to 1979
- Topics cover computer science literatures
- Queries were generated students and faculty of computer science department (Relevance judgment were also done by the same people)

#### The ISI Collection

- 1460 documents selected from a collection assembled at Institute of Scientific Information (ISI)
- The Cystic Fibrosis (CF) Collection
  - 1239 documents indexed with the term "cystic fibrosis" in National Library of Medicine's MEDLINE database

much human expertise involved

# The Cystic Fibrosis (CF) Collection

Relevance Threshold	Queries with at Least One Relevant Document	Minimum Number of Relevant Documents	Maximum Number of Relevant Documents	Average Number of Relevant Documents
1	100	2	189	31.9
2	100	1	130	18.1
3	99	1	119	14.9
4	99	1	114	14.1
5	99	1	93	10.7
6	94	1	53	6.4

- 1,239 abstracts of articles
- 100 information requests in the form of complete questions
  - 4 separate relevance scores for each request
- Relevant docs determined and rated by 3 separate subject experts and one medial bibliographer on 0-2 scale
  - 0: Not relevant
  - 1: Marginally relevant
  - 2: Highly relevant

## User Actions as Implicit Relevance Judgments

- Query logs that capture user interactions with a search engine have become an extremely important resource for web search engine development
- Many user actions can also be considered implicit relevance judgments
  - If these can be exploited, we can substantially reduce the effort of constructing a test collection
  - The following actions (i.e., clickthrough data) to some extent may indicate the relevance of a document to a query
    - Clicking on a document in a result list
    - Move a document to a folder
    - Send a document to a printer, etc.
- But how to maintain the privacy of users?

## More on Clickthrough Data

- May use clickthough data to predict preferences between pairs of documents (high correlation with relevance)
  - Appropriate for tasks with multiple levels of relevance (graded relevance), focused on user relevance (rather than purely topical relevance)
  - Clickthough data can also be aggregated to remove potential noise and individual differences
- Skip Above and Skip Next
  - click data

 $d_1$   $d_2$   $d_3$  (clicked)  $d_4$ 

generated preferences

$$d_3 > d_2$$
  
 $d_3 > d_1$   
 $d_3 > d_4$ 

Preference: documents with more relevance should ne ranked higher.
